Dear Hiring Manager,

Infrastructure is the silent engine of every high-performing engineering team. After two years of IT consulting — building CI/CD pipelines, automating enterprise workflows, and securing cloud environments for international clients — I am ready to bring that operational rigor and automation-first mindset to your team as a DevOps Engineer.

Automating the path from code to production

At InsightSec, I designed and implemented n8n workflow automation for SME clients across retail, F&B, and shipping sectors — saving 3+ hours daily on repetitive operational tasks. At a stealth AI startup, I built a fully automated CI/CD pipeline using GitHub Actions that reduced the release cycle from 2 days to 15 minutes. In my MSc dissertation project (Smart Parking Space Detection), I deployed Kubernetes and Docker microservices with GitHub Actions-driven CI/CD, again achieving that same sub-15-minute release cycle. I believe the best DevOps work is invisible — when pipelines run smoothly, engineers can focus on building, not babysitting deployments.

Cloud security and compliance at scale

Cloud security is not an afterthought — it is a design principle. At InsightSec, I coordinated KnowBe4 phishing campaigns for YumChina covering 5,000+ users, ran ISO 27001 gap analysis for Xihua Foods auditing 200+ documents, and managed cloud security training for Decathlon's retail operations across France. I understand that security at scale requires both technical controls and human-facing compliance processes, and I have hands-on experience delivering both.

Platform and toolchain experience

My production toolchain includes GitHub Actions for CI/CD, Docker and Kubernetes for containerisation, Linux for server administration, and Azure for cloud hosting. I have deployed containerised full-stack applications, written Bash automation scripts for cross-team workflows, and created engineering documentation in GitBook. I am also a daily practitioner of AI tools (Claude, n8n, OpenClaw) that I use to accelerate DevOps workflows — scripting, log analysis, and runbook authoring included.

Why this role, and why now

DevOps is not just about tools — it is about building the culture and infrastructure that lets engineering teams ship with confidence. I am drawn to this opportunity because it combines the technical challenge of scaling reliable infrastructure with the collaborative dimension of working closely with product and engineering teams. I bring hands-on experience across the full DevOps lifecycle: CI/CD design, containerisation, cloud security, compliance, and workflow automation. I am fluent in Chinese and English, which I understand is important for this role.

I am excited about the possibility of contributing to your team's infrastructure and would welcome the opportunity to discuss how my background aligns with your needs. Thank you for your time and consideration.

Best regards,

Yuanshuo Du
