Dear Hiring Manager,

I am a hybrid technologist who builds, automates, and ships. After two years of IT consulting and an MSc in Computer Science, I have spent the past year designing and deploying production-grade systems – from Kubernetes-based CI/CD pipelines for Smart Parking space detection (reducing release cycles from 2 days to 15 minutes), to n8n workflow automation for enterprise clients handling sensitive data. I am ready to bring that hands-on, full-stack DevOps skill set to your team.

Building and automating pipelines end-to-end

My MSc dissertation project, Smart Parking Space Detection, gave me direct experience with the full DevOps stack: Kubernetes and Docker for microservices orchestration, GitHub Actions for fully automated CI/CD, Go and Node.js for backend services, and PostgreSQL for real-time data. I reduced the release cycle from 2 days to 15 minutes through pipeline automation – a tangible, measurable improvement. At a stealth AI startup, I built and maintained automated testing and deployment workflows using GitHub Actions and Docker, improving release cycles by the same order of magnitude.

Automating enterprise workflows at scale

At InsightSec, I designed and implemented n8n workflow automation for SME clients including Decathlon and COSCO – automating repetitive operational tasks and saving 3+ hours daily per team. I have hands-on experience with ISO 27001 gap analysis and compliance tooling, having coordinated security awareness programs for organisations with 5,000+ users (YumChina). I am comfortable working in regulated environments where automation must meet audit and compliance requirements.

Platform and scripting fluency

I work daily in Linux environments and write production-grade scripts in Bash and Python for automation, testing, and deployment tasks. I have practical experience with Azure cloud services and container orchestration on Kubernetes. I bring a solid foundation in networking, server administration, and security hardening – the unglamorous but essential work that keeps production systems running reliably.

Why this role, and why now

I am looking for a DevOps or SRE role where I can own meaningful infrastructure and automation work – not just maintain it. Your team is solving real operational challenges at scale, and I want to be part of that. I bring the combination of hands-on pipeline-building experience, cloud platform fluency, and the consulting mindset needed to understand both the technical and business sides of reliable system delivery.

I am excited about the possibility of contributing to your team's infrastructure and would welcome the opportunity to discuss how my background aligns with your needs. Thank you for your time and consideration.

Best regards,

Yuanshuo Du
